### REPORT

TO

The Right Honourable SIR CHARLES DILKE, Bart., M.P., President of the Local Government Board, &c. &c.

General Register Office, Somerset House, 31st March, 1883.

(1881.)

SIR.

I HAVE the honour to submit to you the detailed abstracts of the marriages, births, and deaths that were registered in England and Wales during the year 1881, and, in accordance with previous custom, to make the following report on the more important features in the vital statistics of that year.

Increase of Population.—The numbers of births and deaths registered in the year were 883,642 and 491,935 respectively, so that the natural increment of the population, or excess of births over deaths, was 391,707; an increment far higher, both proportionally and absolutely, than was recorded in any of the three preceding years, and amounting to 1.52 per cent. on the population of the immediately preceding year 1880. This rise in the natural increment was due, as will be hereafter seen, not to the introduction of an exceptional number of new comers into the population,—on the contrary, the birth-rate was the lowest on record for 22 years,—but to a great diminution in the deaths, only one person out of 53 having died during the year, whereas the best record in any previous year had been one death out of 49 persons living.

The actual growth of the population is, however, determined not entirely by its natural increase, but to some extent by the balance between emigration and immigration; a balance which cannot be struck with more than roughly approximative accuracy. It would appear, however, from the returns made by the Board of Trade that the loss from excess of emigration in 1881 must have been much above the average. For, while the emigrants of English or Welsh birth who left the United Kingdom were 64.5 per cent. above the average of the five preceding years, the recorded immigrants of all nationalities were only 2.63 per cent. above the average for the same period.

The population, as enumerated in April 1881, numbered 25,968,286\* persons; and, on the hypothesis that the rate of increase continued to be the

<sup>\*</sup> This is the unrevised number, as published in the Preliminary Census Report, which has been used throughout this Report. The revised number for publication in the final Report is 25,974,439.

same as it had been in the interval between that and the previous census, the number of inhabitants of England and Wales in the middle of 1881 was 26,055,406. Of these, 12,676,276 were males and 13,379,130 were females. This is the population on which the rates in this Report have been calculated.

#### MARRIAGES.

The marriages in 1881 numbered 197,290, giving a rate of 15°1 persons married to 1000 persons living. With the single exception of 1853, the marriage-rate was at its maximum in 1873, in which year it reached 17°6. From that date it fell continuously, year by year, to 1879, when it was at its minimum, and as low as 14°4. In 1880 it began to recover from this long depression, and was 14°9; and in 1881 a still further slight improvement occurred, and the rate, as already stated, rose to 15°1.

Among foreign European states, Austria, Belgium, Denmark, and Italy, showed a similar recovery, while the rate still remained depressed in the German Empire, in Switzerland, in Sweden, and in Holland (see

Table 74).

In my last Annual Report it was pointed out that the marriage-rate reflects with much accuracy the condition of public welfare, and that its fluctuations coincide, in direction though not in degree, with the fluctuations in such measures of commercial activity, as the total value of imported and exported merchandise. It was also pointed out that the fluctuations in the marriage-rate coincide more closely with those of exports of British goods than with those of imports. The year 1881 has given additional confirmation to that statement; for in that year, coincidently with the rise in the marriage-rate, there was a rise in the value of exports, but a fall in the value of imports. It will be seen in Table A. that twice only in the 22 years, the changes in which are shown, did the marriage-rate and the exports move in different directions, whereas the marriage-rate and the

imports moved diversely on seven occasions in the same period.

Increased commercial and industrial activity implies higher wages or an increase in the number of persons receiving wages, and this, of course, it is that determines the coincident rise in the marriage-rate. It might naturally be anticipated that the same result that is produced by high wages would also be produced by what would seem to be practically much the same thing, namely, cheap food; and in fact it is often stated that such is the case, and that marriages increase in number as the price of food goes down. But, strange as it may seem, the very opposite appears to be the case, at any rate of late years in this country, and with the price of wheat taken as a standard. The price of wheat and the marriage-rate have varied during the last ten years together, and not inversely, as is clearly shown in Table A. It will there be seen that from 1870 to 1873, wheat was getting dearer and dearer, and that simultaneously the marriage-rate was getting higher and higher. From 1873 to 1879, the marriage-rate fell continuously, and with it fell also, though not in quite such unbroken continuity, the price of wheat. In 1880 a change occurred, the marriage-rate rose, and continued to rise in 1881, and so also did the price of wheat.

The parallelism of these fluctuations, taking them as a whole, is too close to be attributable to mere accident. It is not easy, however, to suggest any adequate explanation of the fact. Can it be that the same cause which leads to increased marriages, namely, high wages or more employment, leads also to a greater consumption of bread, and that the price of wheat goes up, with this increased demand? If so, we should expect that a high marriage-rate would correspond with high prices of other articles of consumption; and as a matter of fact it will be seen in

Table 46, that the year in which the marriage-rate reached its maximum, namely 1873, was also the year in which the mean prices of beef, of mutton, of potatoes, and of sea-borne coal, in the London Market, were at their maxima.

Note.—The figures in the marriage-rate column are not strictly comparable with those in the value columns, inasmuch as the former relate only to England and Wales, while the latter relate to the whole of the United Kingdom. The figures in the value columns are derived from the Board of Trade Statistical Abstracts, but have been slightly altered in accordance with later and more accurate estimates of the population.

It was pointed out in my last Annual Report, that just as the greatest depression in the marriage-rate had occurred, speaking generally, in the mining districts, then in the manufacturing districts, and last of all in the agricultural parts, so also had the recovery followed, on the whole, the same order; that is to say, that those counties, which had been most depressed, were also those that had recovered most. It will be seen in Table B. that though the further recovery in 1881 followed, in some degree, the same course, yet that in that year the agricultural counties showed signs of sharing, to a much larger extent, in the general recovery; for, among counties in which the rate of increase was far above the average of the whole country, will be seen Bedfordshire, Cambridgeshire, Buckinghamshire, Oxfordshire, and Worcestershire,

Table B.—Decrease per Cent. of the Marriage-rate in 1879 in Counties from the erage Rate of 1872-73, and the Increase or Decrease in 1880 and 1881, as compared with the ratio in the preceding year.

and the second of the second o	No. of the last of		

<sup>\*</sup> The years 1872-3 are taken as the basis of comparison, because these are the years in which the marriage-rate was at its maximum.

The marriages are by no means equally spread over the year. In England and Wales as a whole, and also in the individual counties without exception, there are fewer marriages in the first quarter than in any other. The maximum quarter, both in the entire country and, with three

exceptions, in each county, is the fourth; while between the second and third there is but little difference, the second, however, having in the long run the preference. The three counties which are except ns to the otherwise universal rule of the maximum falling in the Christmas quarter are Herefordshire, Shropshire, and, in a notable degree, Lincolnshire\*; in each of which, on an average of 7 years (1875-81), the maximum fell in the second and not in the fourth quarter. Disregarding such exceptions, for which local explanations are probably to be found, the predominance of the fourth quarter, is, as a rule, much more marked in purely agricultural counties than elsewhere; presumably because in agricultural districts the fourth quarter is a period of comparative leisure, whereas in industrial or, speaking generally, in urban districts there is much less distinction between one season of the year and another as regards occupation. Compare, for example, Lancashire or London with the following five corn-growing counties, Cambridgeshire, Essex, Norfolk, Suffolk, and Huntingdonshire.

TABLE C.—MARRIAGES in each QUARTER per 1000. 1872-1881.

<del></del>	1st Quarter.	2nd Quarter.	3rd Quarter.	4thQuarter.

	198	250	267	285
	224	252	256	267
	182	216	220	382

In this country the marriages are only abstracted by quarters; but, in order to afford means of comparison with those foreign countries in which the marriages are abstracted by months, they have been this year taken out in greater detail for a single county, viz., Gloucestershire, and for a single large town, viz., Manchester. The first two columns in the following Table give the results; the months having been reduced to an equality as regards number of days. Other columns are added, giving the figures for some other countries.

December	126	115	173	62	101	97	63	51	94

<sup>\*</sup> It was noticed so long ago as in the 27th Annual Report (1854) that "Lincoln"shire is the only county in which the spring weddings exceed the autumn weddings
"in number." Possibly the custom in that county of hiring labourers from April 6th
to April 6th in the succeeding year may have to do with this.

The county of Gloucestershire, comprising, as it does, the bulk of the great town of Bristol as well as a large agricultural population, may be taken as fairly representing the total of England and Wales, and it was selected because, as a matter of fact, the distribution of its marriages by quarters was found to correspond very closely with the distribution in the country at large. It will be noticed that the months in which most marriages occurred were December, October, April, and June. The excesses in December, April, and June were due to the festival periods of Christmas, Easter, and Whitsuntide, respectively; while the excess in October marks the period of leisure, and of cash in the labourer's pocket, which follows the close of harvest-time. This excess in October would doubtless have been still more marked, had a purely agricultural country been selected; for in the completely urban population of Manchester, no such excess in October is noticeable, whereas the festival months of Christmas and Whitsuntide show high figures. In the town the Whitsuntide marriages, in June, were much more numerous than the Easter marriages, in April; whereas in the county, the reverse was the case, a difference which may be attributed to the fact that the agricultural population was busy in June with the hay. In both town and county the marriages in May were below the average number in the other months, May being for some reason or other very generally regarded as a month of ill-omen for wedlock. The feeling against marrying in May is not easy of explanation. It is not common to all countries. On the contrary, in Germany, in Denmark, and in Switzerland, this month appears from the Table to be a favourite time for weddings. That it is attributable to May being "the Virgin's month" seems scarcely compatible with the fact that in Catholic France, where such a cause would be expected to have much more influence than in Protestant England, the May marriages are slightly in excess. Not impossibly the custom may be a survival from Roman times; for in ancient Rome also it was deemed to be unlucky to wed in May, it is said because the Lemuria, or festival of the Departed Souls, was held in that month.

" Mense malas Maio nubere vulgus ait."—(OVID).

In Scotland the marriages in May are in even smaller proportion than in England. The Registrar General of that country, however, attributes this neither to religion nor to superstition, but simply to the fact, that in Scotland May is the month in which it is customary to change servants and to give up farms and houses, so that there is but little leisure time left for connubiality.\* In both the county and the town the marriages were few in each of the first three months of the year, partly because of the clearing off which had occurred in the immediately preceding December, partly because there was no great public festival time in any one of these three months, and partly because of the incidence of Lent, the greater part of which season fell in March.

<sup>\*</sup> The marriage of Mary Queen of Scotland to Bothwell was celebrated at Holyrood in May. The next morning the line quoted above from Ovid was found written on the gate of the palace. Some writers have ascribed to the memory of this ill-omened match the Scotch aversion to May weddings. Cf. Schiern's Life of Earl of Bothwell, p. 257.

There are not only favourite months for weddings, but also favourite days, as is shown in the following table:—

TABLE E .- MARRIAGES on each DAY of WEEK, per 1000.

Day of Week.	Gloucestershire, 1881.	Manchester, 1881.	Certain English Districts, 1864.	Scotland, 1862.
Sunday	208	221	321	9
	211	178	215	129
	136	74	106	176
	94	111	78	68
	123	105	87	120
	20	24	22	433
	213	287	171	65

Saturday, Sunday, and Monday, are the favourite days for weddings, and, taking Gloucestershire, as before, to represent the entire country, these three days stand much on a par with each other; while in the purely urban population Saturday is far ahead of the other six. Comparing the above figures for 1881 with those for certain districts, mainly urban, in 1864, as given in the Annual Report for that year, and repeated in the above Table, Sunday is not so favourite a day for weddings as it was; its place being usurped to a great extent by Saturday. In both county and town, Friday is a day on which marriages are rare; and in this respect there is no diversity between the figures for 1864 and the more recent ones. Doubtless this marked dislike for Friday was originally founded on ecclesiastical restrictions, which have, however, degenerated in the vulgar mind into an unreasoning superstition against the day, as unlucky. That the aversion to it, however it arose, can no longer be attributed entirely to religious feeling (I say "not entirely," because the considerable diminution of marriages during Lent, both in the town and the county, shows that religious feelings are not without considerable influence in the matter), is clear from the fact, that the Friday which of all Fridays should be the most strictly observed, namely Good Friday, is exceptionally a favourite day for marriage, at any rate in towns; for whereas the average marriages in Manchester on other Fridays in the year 1881 numbered 2'18, on Good Friday there were as many as 36; while the average for all days in the year was but 17.04.

In this matter of days there is a strange contrast between England and Scotland, as was pointed out many years ago by the Scotch Registrar General (Supplement to Reports 1861-70, p. 40). In Scotland, as shown in Table E., nearly half the weddings are on Friday, while the strict Puritanical notion as to the sacredness of the Sabbath, and in a less degree of the Sabbath-eve, practically stops all marriages on Sundays, and reduces those on Saturday to a very low figure.\*

In Scotland the day of days for weddings is December 31st, owing to the first day of the year being a general holiday, so that the wedded pair have a whole day's holiday before them. On that single day no less than 5.35 per cent. of all the marriages in the year are contracted. In England, where the first day of the year is not a general holiday, nothing of the kind occurs. The marriages on December 31st, 1881, which fell on Saturday, were, it is true, somewhat above the average of other Saturdays, but in

<sup>\*</sup> In Scotland most marriages are celebrated in private houses and in the evening, not as with us in Church and in the morning. As Sunday and Saturday evening are deemed unsuitable for weddings on religious grounds, Friday evening becomes the most convenient time, followed as it is by the half holiday of Saturday, and the whole holiday of Sunday.

no remarkable degree. The favourite days in England appear to be Christmas Day, Easter Monday, and Whit Monday, with the days preceding and following them, and, after these, the Bank holiday on the first Monday in August.

Forms of Marriage.—Of the 197,290 marriages celebrated in 1881, 140,995, or 71.5 per cent., were solemnised according to the rites of the Established Church, and 56,295, or 28.5 per cent., otherwise. The proportion of Established Church marriages was very slightly lower than in the immediately preceding year, and this slight decline was entirely due to an increase in the proportion of Roman Catholic marriages, which was higher than in any year since 1866. The subjoined Table shows the proportion of marriages in the Established Church, by license, banns, and Superintendent Registrars' certificate. It will be noted that the proportion of marriages by banns continued to increase, and at the expense of marriages by license.

Table F. — Of the Marriages celebrated in the Established Church, the Proportion per Cent. by Special License, License, Banns, and by Superintendent Registrar's Certificate, 1841–81.

<sup>\*</sup> The Church marriages not otherwise described have been proportionally distributed over the beadings "Special License," "License," "&c.

In 524 church marriages, the particulars required for the accurate construction of the foregoing Table were not furnished, owing to the negligence

of the officiating clergymen.

Of the 56,295 marriages, not according to the rites of the Establishment, 8784, or 15.6 per cent. were solemnised in Roman Catholic places of worship, 50 were marriages according to Quaker rites, 21,922, or 38.9 per cent., were solemnised in the chapels of other Christian denominations, 484 were marriages of Jews, and 25,055, or 44.5 per cent., were marriages in the offices of the Superintendent Registrars.

First Marriages; Re-marriages. Males.—Of the 197,290 men who married in 1881, 172,122, or 87 2 per cent. were bachelors,\* while 25,168, or 12.8 per cent., were widowers.

Of the 172,122 bachelors, 163,871, or 95 2 per cent., married spinsters, while 8251, or 4 8 per cent., married widows.

<sup>\*</sup> The 51 divorced men who re-married in the year are here reckoned as bachelors and the 53 divorced women as spinsters.

Of the 25,168 widowers who re-married, 15,230, or 60.5 per cent., married spinsters, while 9938, or 39.5 per cent., married widows.

Females.—Of the 197,290 women who married, 179,101, or 90.8 per cent., were spinsters,\* while 18,189, or 9.2 per cent., were widows.

Of the 179,101 spinsters, 163,871, or 91.5 per cent., married bachelors,

while 15,230, or 8.5 per cent., married widowers.

Of the 18,189 widows who re-married, 8251, or 45.4 per cent., married

bachelors, while 9938, or 54.6 per cent., married widowers.

Thus the re-marriages of widows were, as always, much fewer than the re-marriages of widowers, and while of widowers who re-married far the greater number married spinsters, among widows the reverse was the case, and the greater number were wedded to widowers.

Divorce.—The marriages of persons described as divorced, which had been increasing for many years until in 1880 they attained their maximum number of 117, declined again in 1881 to 103. It must be noted, however, that the figures given in the following Table refer only to persons described in the marriage register as divorced, and that very probably this description is not given in all cases in which it is applicable.

Ages at Marriage.—In 32,316 cases the officiating minister or registrar neglected to insert the ages of both parties in the register. The mean age at marriage, as determined for the 164,974 couples whose ages were duly stated, was 28°0 years for the men, and 25°7 for the women. The mean age of the bachelors was 25°9 years, that of the spinsters 24°4. The mean age of bachelors and spinsters at marriage is remarkably constant, year after year. Once in the past 15 years, viz. in 1873, when the marriage-rate was at its maximum, the mean age of the bachelors was 25°6, and in 1881, as above stated, it was as high as 25°9, but in each other year it was either 25°7 or 25°8. The mean age also of spinsters in 1873, the year of maximum marriage-rate, was as low as 24°2, but in every other year it was either 24°3 or 24°4, or, on one occasion, viz. 1867, 24°5. The mean age of widowers who re-married was 43°4, and of widows 39°8 years.

Of the men who married in 1881, there were 341, of whom 14 were bachelors, who had passed the mature age of 70 years; and of the women who married there were 58, of whom 8 were spinsters, who were of similarly

advanced age.

On the other hand 14,224 men and 42,138 women were under age when wedded, being 7.24 per cent. of all the bridegrooms, and 21.31 per cent. of all the brides. The proportion of minors who married was at its maximum for each sex in 1874, and has declined ever since, though, in the case of females, with some irregularity.

Signature in Marriage Register.—In the year 1850 the proportion of persons who at the time of marriage were unable to sign their names in the register was 38.7 per cent. From that date the proportion fell continuously for 29 years, with only one exception, viz. 1863, in which year the proportion remained exactly as it had been in the immediately preceding year. On no single occasion in these 29 years did the proportion of illiterate marriages increase. In 1880, however, for the first time a slight retrograde movement occurred quite unexpectedly. The proportion of illiterate brides and bridegrooms not only ceased to decline, but actually rose in a slight degree. In my report for that year it was pointed out that the probable explanation of this unexpected occurrence was that the revival of trade, which had led to a rise in the long depressed marriagerate, had especially affected the lower strata of the wage-earning class, who are moved to matrimony by very trifling improvement in their pecuniary condition, and that it might be anticipated that the check was but tem-This anticipation was realised; for the proportion of illiterates fell again in 1881 from 16.3 to 15.6 per cent. This proportion was, however, still much higher than the rapid progress made in previous years in the matter of elementary education would have led us to expect. the proportion of illiterates fallen as rapidly in the interval between 1879 and 1881, as it did in the interval between 1877 and 1879, the proportion of persons who could not write their names would have been 14.5 per cent., whereas, as already stated. it was in fact 15.6. It would appear, therefore, that the marriages in 1881 were still in more than usual proportion among the lower stratum of the working classes.

Buildings registered for the Solemnisation of Marriages.—The number of buildings registered for the solemnisation of marriages not according to the rites of the Established Church, and on the register at the end of the year 1881, was 8,827 (see Table 11), showing an increase of 214 during the year. Of this increase, Independents contributed 26, Baptists 27, Roman Catholics 17, Wesleyan Methodists (of all branches) 104, Calvinistic Methodists 12, and all other sects 28.

Certified Places of Worship.—There were 21,366 certified places of worship on the register on 31st December 1881, showing an increase of 580 during the year; there were 647 new buildings registered during the year, whereas 67 buildings were removed from the register by cancellation.

#### BIRTHS.

The total number of births registered in 1881 was 883,642, being in the

proportion of 33.9 births to 1000 persons living.

This was the lowest birth-rate recorded since 1858, when the rate was 33.7. At that period, however, the registration of births was not compulsory, and doubtless a considerable number of births were omitted from the reckoning. The birth-rate was at its maximum in 1876, and fell uninterruptedly from that date, year by year, in natural accordance with the corresponding decline in the marriage-rate.

The rate varied greatly in different counties, being lowest in Herefordshire, Huntingdonshire, Cornwall, Dorsetshire, Devonshire, Rutlandshire, and Shropshire, in none of which was it above 29.5; and highest in Lancashire (36.1), Nottinghamshire (36.8), Staffordshire (38.0), and Durham (39.5). It will be seen by reference to a table in a former report (1879, Table G. p. xiv.) that, in each of the counties here mentioned as having a low birth-rate, the proportionate number of young married women is much below the average, while in each of the counties distinguished by a high birth-rate the contrary is the case.

Illegitimate births.—The illegitimate births numbered 43,120, being in the proportion of 4.9 to every 100 children born. This is a higher proportion than any recorded for six years previously, but is to be explained, not by any increase in the illegitimate births, but by a falling off in the legitimate births owing to the decline in marriages. The illegitimate birth-rate, that is, the proportion of such births to 1000 persons living, remained at the same point as it had been at for the six preceding years, namely, 1.7. It is satisfactory to note that, notwithstanding the long continued depression in the marriage-rate, the illegitimate birth-rate has remained unaffected throughout, and at its lowest level (Table 13). The counties, in which the proportion of children born out of wedlock to all births was the highest, were Shropshire, Cumberland, Norfolk, Herefordshire, and Westmorland; all of which are counties that are found to have had a like evil pre-eminence in the ten preceding years (Table 14).

Sex.—The male births numbered 450,180, and the female births numbered 433,462, so that the former were to the latter in the proportion of 103.9 to 100. This was a slightly higher proportion than in either of the two immediately preceding years, in each of which the proportion had been 103.6.

#### DEATHS.

The deaths registered in 1881 numbered 491,935, and, notwithstanding the increased population, were absolutely fewer than in any single one of the twelve preceding years. The death-rate was 18 9 per 1000 living; a rate which was no less than seven per cent. lower than the lowest recorded in any previous year since civil registration began. In 1877, when the lowest previous death-rate occurred, one person died out of every 49 living;

in 1881 only one died out of 53.

There is nothing in the series of annual reports issued by this office that comes out more distinctly and unmistakably than the wonderful effect which the sanitary operations of the last decade have had in saving life. The Public Health Act came into operation in 1872. The average annual death-rate for the immediately preceding ten years (1862-71) had been 22.6, and there were no indications whatsoever of any tendency of the rate to fall lower. Indeed in 1871, the final year of this period, the rate was exactly the average, viz., 22.6. The Act came into force; and at

xvi Deaths.

once the rate began to fall, and continued to fall year by year with almost unbroken regularity, until in 1881 it was, as above stated, no more than 18.9. Once only in the ten years that had elapsed since the Act came into operation was the rate as high as the average of the previous decade. That was in 1875, when the rate was 22.7. In that year a second Public Health Act, of more stringent character, came into operation; and from that date down to 1881 the death-rate did not once reach 22.0, and

averaged no more than 20.5. Had the fall in the death-rate been limited to a single year, or to two years, or even to three, it might have been argued by sceptical persons that the improvement was due to a succession of seasons favourable to health, or to other causes unconnected with sanitary administration, and that the setting-in of the fall coincidently with the coming-into-operation of public health measures was no more than casual; but in face of a fall, lasting for ten years in succession and increasing each year in amount, no one can seriously maintain such a position. There can be no real doubt that the saving effected in life was the direct product of the money and labour expended in sanitary improvements. Doubtless the money thus expended was enormous in amount; and it will be well therefore to consider what return it has brought in. If, then, the death-rate in 1881 had been only equal to the average death-rate in the decade preceding the Public Health Act of 1872, there would have died in the course of that one year 95,917 persons who, as it was, survived. From this total, however, a deduction must be made of some 5,000 for the following reason. The birth-rate in 1881 and in each of the two immediately preceding years was considerably below the average annual birth-rate in 1862-71. Consequently there was a smaller than average proportion of children in the first three years of life in the population of 1881. But the death-rate at this early period of life is always very high. Had the birthrate in 1879, 1880, 1881 been equal to the average birth-rate in 1862-71, there would have been so many more young children living in 1881 as to have increased the deaths in that year by a number close upon 5,000. Instead, therefore, of 96,917 lives saved, we have only about 92,000.

Now we shall probably be well within the mark if we assume that for every fatal case of illness there are from four to five more cases which end in recovery. This is about the proportion in enteric fever, which is a more fatal disease than the average of diseases. The result, therefore, on this assumption would be that, speaking in round numbers, there were 500,000 fewer cases of illness, and 92,000 fewer deaths in England and Wales in 1881 than would have been the case had the population been living under the conditions that existed in 1862-71. It may perhaps be objected, and not unreasonably, that the year 1881, with its extraordinarily low death-rate, was so exceptional that it can hardly be taken as a fair sample by which to measure the annual return in life and health from the moneys spent in sanitary improvements. Let us then take the entire period of ten years that elapsed between the first Public Health Act and the close of 1881. Had the death-rate remained during that period at its mean level in the preceding decade, the total deaths from 1872 to 1881 inclusively would have been 5,548,116; whereas they were actually no more than 5,155.367. Thus no less than 392,749 persons who under the old regime would have died were, as a matter of fact, still living at the close of 1881.\* Add to these saved lives the avoidance of at least four times as many attacks of non-fatal illness, and we have the total profits as yet received from our sanitary expenditure. Moreover, it is important to note that these profits were not equally spread over the ten years, but that there was a manifest tendency to progressive increase throughout the period.

<sup>\*</sup> The mean birth-rates in the two decades 1862-71 and 1872-81 were almost exactly the same; so that no correction need be made in this case.

Deaths. xvii

This is what might be anticipated; for the full effect of sanitary improvements requires time for development.

Locality.—The fall in the death-rate in 1881 was very general. There was no county, as may be seen in Table 20, in which the rate was not below the mean of the previous ten years, and scarcely one in which it was

not the lowest rate in that period.

The death-rate in the urban population, consisting of some fifteen and a half million persons, was 20°3, while that of the rural population, comprising some ten and a half million persons, was 16°8. Of equal numbers living, (Table 47) there were 121 deaths in the urban districts to 100 deaths in the rural districts, which corresponded with the average proportion of the preceding decennium.

Sex.—Of the deaths registered in the year, 253,605 were of males, and 238,330 were of females. The male death-rate was 2000, and the female death-rate was 1708, the mean annual rates for the preceding decennium (1871-80) having been 2208 and 2001 respectively. Out of equal numbers living of each sex there died 1124 males to 1000 females. The average proportion for the preceding decennium was 1134 to 1000.

Age.—The decline in the death-rate was not only shared by all parts of the country, and by both sexes, but also by all periods of life. It was greatest, however, in the first period of life, among children under five years of age. It was especially great in the first year of life (see Table 27); for, while the mean infantile death-rate—that is, the proportion of deaths under one year to 1000 births—was 149 in 1871-80, the rate in 1881 was 130.

#### REGISTERED CAUSES OF DEATH.

The new Classification.—For some years past, three different classifications of the assigned causes of death have been used in the annual reports issued by this office. There was firstly, a long list, consisting of 273 headings, which was used for tabulating the causes of death in England and Wales as a whole (see pp. 146-155, 43rd Ann. Rep.) Secondly, there was a shorter list, consisting of 117 headings, which was used for the Registration Divisions and Counties (see pp. 162-185, 43rd Ann. Rep.), and which had this great defect, that the headings with special names, in many cases, did not stand for precisely the same causes of death as the

xviii Deaths.

identically similar headings in the longer list. For instance, while the heading "laryngitis," in the longer list, stood exclusively for the disease called by that name, in the shorter list it also included " œdema glottidis," and "laryngismus stridulus," which were grouped with laryngitis for the sake of brevity. This shorter list was also used for the table of comparative mortality in successive years in all England and Wales (see Table 31, 43rd Ann. Rep.) Thirdly, the causes of death in all England and Wales were again classified according to the arrangement adopted in the nomenclature of the Royal College of Physicians of London (see Table 60, 43rd Ann. Rep.) The inconveniences of this triple classification are obvious, and, after mature consideration, it was determined to abandon it, and to substitute some one form of classification for the three. The classification which had the sanction and authority of the Royal College of Physicians was of course the one which naturally recommended itself for selection. But it unfortunately happened that the college was itself engaged in revising its former classification; and it was impossible to wait until this revision should be completed, because any important change in the classification used in the General Register Office must necessarily be made in the first year of a decade, owing to the requirements of the decennial supplement, the compilation of which would be rendered still more laborious than at present, or indeed would be practically impossible, if the tabulation of the successive years with which it deals, were not

throughout identical, or nearly so, in form.

But, although the College of Physicians had not as yet published their revised nomenclature and classification, the arrangement, which would almost certainly be adopted by that body, was already known, if not in complete detail, yet in sufficient completeness for practical purposes; and it was therefore decided to adopt a form of classification which should follow the lines thus laid down by the chief medical authority in the country as nearly as might be, considering that neither the things to be classified nor the objects of the classification were precisely the same, and that limitation of space would necessarily involve some considerable shortening of the full college list.\* In the first place the college classification includes all varieties of morbid affections, serious or slight, and of these the majority are never fatal, and therefore never appear among the causes of death, with which alone the General Register Office has to On the other hand, a very large number of deaths are ascribed on the certificates to causes which are not recognised by the college as distinct diseases, but are vague indeterminate names, equally applicable to several distinct ailments. If the Royal College of Physicians, besides providing an authoritative nomenclature of diseases, could also prevail on medical men to use no other terms, in certifying as to causes of death, than those thus sanctioned, the tabulation of deaths would be carried out with much greater precision, and in a much more satisfactory manner, than is possible with the present lax use of medical terms. As to the careless manner in which the causes of death are too often stated in certificates, some observations will have to be made presently. For the present purpose it is sufficient to have pointed out that, while the college classification is of diseases, the classification of the General Register Office must be of assigned causes of death, and that these are far from being one and the same thing. Secondly, the objects aimed at by the College of Physicians and by the General Register Office in their classifications are not precisely the same. The classification of the college is, in the main, pathological, but the classification of the Register Office, intended, as it mainly is, for the use of those engaged in devising methods of prevention, should, so far

<sup>\*</sup>The change of classification was made after due consultation with the Registrar General for Ireland, and it was agreed that the same system should be followed in both countries.

Deaths. xix

as possible, be actiological. This difference of object especially affects the classification of injuries. The College classifies these by their nature and position, but takes no cognizance of the cause to which they were due. A man has, let us say, a cut on the head, which lays bare the bone; this is classified by the college list as, "a scalp-wound; bone exposed," and there is an end of the matter. Whether the wound was accidental or homicidal or self-inflicted is, of course, from the purely medical point of view a matter of complete indifference. But this consideration, pathologically so unimportant, is practically the only one, or at any rate the chief one, that is of interest from any other point of view than the strictly medical. How many persons are murdered, how many commit suicide, how many meet their deaths from accidents of various kinds, are points of much more importance to the general public and to those who are studying how to increase the security of life, than how many die from injuries to this or that distinct part of the body, or from this or that special kind of wound.

The College, again, give no names to their groups or sub-groups of diseases. To follow this example would, however, cause great practical inconvenience in an office where more than half a million of deaths have to be sorted out annually, and where the various groups and sub-groups have repeatedly to be referred to and spoken of in some way or other. Names, therefore, have been attached to the several groups and sub-groups, and, in selecting these, regard has of course been paid, so far as possible, to former usage in the annual reports. Doubtless some of the names thus given are open to considerable criticism, especially on the part of those who expect that a name shall not serve merely as a convenient distinguishing mark, but shall express with unexceptional accuracy the nature of the thing or things to which it is attached. When such more suitable names shall have been found, it will be easy to substitute them for those now adopted, which must therefore be looked on as merely provisional.

Very probably there may be some other small points in which the classification, now adopted for the annual reports, may, for the sake of convenience or of brevity, be somewhat different from that of the College of Physicians. But speaking generally, and with the exceptions already mentioned, the lines laid down by the college have been followed throughout.

One of the most important uses of a classification of deaths by their alleged causes, when it has been carried out year after year for a considerable period, is that it enables those who are engaged in preventive medicine, or who are studying the natural history of diseases, to compare the mortality from each cause in successive years, and thus to test, in some measure, the effect of sanitary interference, of climatic differences, and of other agencies by which the prevalence of diseases may be affected. It is of course impossible to make any notable change in the system of classification without interfering, more or less, with the possibility of such serial comparisons. It may, however, be noted that, even when the same mode of classification is maintained throughout, without any modification whatsoever, large allowances have to be made for the changing fashion or caprices of medical nomenclature. There are times, for instance, to give a single example, when the ordinary medical attendant designates all deaths from vaguely diagnosed affections of the respiratory organs as bronchitis, and other times when he prefers to designate them all as pneumonia. Allowance has also to be made for the greater precision in diagnosis, which the advance of medical science brings about, and which causes a constant increase in the number of deaths ascribed to definite causes at the expense of deaths of which the causes are indefinitely described. Under these circumstances it may be laid down as a general rule that the serial comparison of mortality from any specified cause, in

XX Deaths.

successive years, is but of little value, unless the particular disease concerning which the investigation is made be some well marked form and such as can be readily recognised by the ordinary practitioner, or unless the inquiry relate, not to some one special disease, but to some large natural group of diseases taken together, such as diseases of the nervous system, or diseases of the respiratory organs. Statistics must not be pressed into services, to which the imperfection of the data on which they are based renders them inadequate.

If these considerations, as to the limits within which comparisons can be fruitfully made between the mortality figures of successive years, be borne in mind, the changes of classification now introduced will be found to offer no material hindrance to such comparisons. Tables have been made (Tables 31-32) in which such comparisons have been carried back for 24 years, for the chief diseases or groups of diseases in the new classification; and, in addition, a further Table has been added (pp. xxix-xxxiv) in which all the modifications that have been made, and by which individual headings are affected, are described in detail.

Inadequate Certification of Causes.—In order that deaths may be properly tabulated by their causes, the first requisite is of course that these causes shall be stated on the certificates with due accuracy and in sufficient detail. Unfortunately in a considerable proportion of cases this elementary condition is far from being satisfied. Not rarely the real cause of death is purposely disguised in order to spare the susceptibilities of friends, or, it may be, to conceal the existence of infectious disease. There can, for instance, be no doubt that a very large proportion of such deaths as occur from congenital syphilis are returned not under that name, but under the vague term atrophy, innutrition, wasting, congenital weakness, cachexia, and the like. More frequently, however, the deficiencies in the certificates are not intentional but due to carelessness, the cause being stated with such insufficiency or in so vague a manner that it is impossible to say to what heading the deaths should be referred. To ascribe a death to "natural causes," to "blood disease," to "constitutional disease," to "congestion" or the like, is to give information, which, however true, is not worth the trouble of tabulation. Scarcely more satisfactory is such an assigned cause as "hæmorrhage," which is of frequent occurrence. Deaths from flooding in childbirth, from an incised wound of an artery, from rupture of an aneurism, from hæmatemesis caused by ulcer of stomach, and from numerous other causes may, one and all, be said to be due to hæmorrhage. But to lump all these diverse cases together under one heading, and to state the total result, would be to give, at the cost of much labour, information of no possible value. Much the same may be said of such causes, when assigned without further particulars, as "peritonitis," "blood poisoning," "tumour," "dropsy," "convulsions," and the like. Yet a vast number of certificates are of this character. An effort was made this year to remedy this evil, and to get greater precision in the statement of causes. With this object letters of inquiry were sent out to medical men who had given certificates in which the causes of death were imperfectly stated, asking for further particulars. The exigencies of office work did not allow of this being done to more than a very limited extent. Still a beginning was made; and it is hoped that the practice now introduced may, by calling the attention of the profession to the matter, induce medical men to recognise the importance of stating the causes of death with greater precision. In all some 1200 letters of inquiry were sent out, and with some few exceptions elicited the requisite information. How necessary some such step had become may be inferred from some of the results of these inquiries.

For instance, 183 letters of inquiry were sent out relating to cases in which the assigned cause was simply pyæmia, septicæmia, or blood-poisoning, without further particulars. The results were as follow:—

In 55 cases, the cause of the condition was unknown.

In 3, ditto, but in parturient women.

In 89 , the cause was puerperal.

In 11..., the cause was cut, stab, or other injury.

In 2r ,, the cause was small-pox, erysipelas, scarlet-fever, or other assignable disease.

In 4,, no further information was given in the reply.

Again, 32 t letters of inquiry were sent out as to cases in which the assigned cause was "peritonitis" only, the cases selected for inquiry being those of women of child-bearing ages. The results were as follow:—

In 155 cases, no special cause for the peritonitis was known.

In 136 the peritonitis was puerperal.

In 14 ,, the peritonitis was consequent on disease of uterus or ovaries.

In 12 ,, the peritonitis was due to cancer, hernia, enteric fever, or other assignable disease.

In 4 , no further information was given in the reply.

To what a serious extent our statistics are affected by the vagueness of certificates, or by the omission of the most important particulars may be further illustrated by the following figures: The 1200 letters of inquiry sent out in the year resulted in the addition of 269 deaths to the heading "puerperal fever," of 61 more deaths to the heading "accidents of childbirth,"\* and of 18 more to the total of "childbirth associated with other diseases." To the heading "tabes mesenterica" there resulted an addition of 87 deaths, and to "syphilis" of 24 deaths. Among the assigned causes of death one of the most unsatisfactory, not only because of its insufficiency but because of the great frequency with which it occurs, is "dropsy." This of course is a symptom of a great number of very diverse diseases, renal, pulmonary, hepatic, and cardiac. Yet in no less than 1882 cases during the year "dropsy" was the assigned cause, without further particulars as to its origin. These 1882 certificates were scarcely more than so much waste paper, so far as classification of deaths by causes is concerned. Seeing that the main object of the expenditure of labour and money in the tabulation of causes of death is the advance of medical knowledge, surely it is not too much to expect that medical practitioners shall not fill in their certificates in so careless a manner, as to render any accurate tabulation an impossibility.

One class of cases there is where at any rate it might be expected that full information would be forthcoming, namely, those cases in which a special inquiry is held at the public expense, in order to ascertain the cause of death. Unfortunately, however, many coroners appear to think that the exclusive object of an inquest is to ascertain whether a crime has been committed, and ignore altogether the other purposes, scientific and medical, to which inquests are intended to be subservient. Such vague findings as "natural causes," "died by visitation of God," "sudden death," and the like, may possibly satisfy the requirements of criminal law, but are utterly inadequate for all other purposes, and cannot be considered as really fulfilling the requirement of the Act, that the coroner shall state in his certificate what was the cause of death. How often verdicts are vitiated by such imperfections may be judged from the following particulars relating to the verdicts in inquest cases held in one division in 1881.

1001.

<sup>\*</sup> One half of the apparent increase (Table 44) in the mortality of women in childbirth in 1881 as compared with 1880 was due to the 330 additional deaths discovered by these letters of inquiry.

There were in all 983 inquests. In 144 of these the verdict was simply "natural causes;" in 13 "visitation of God," in 14 "found dead." In 25 cases the death was ascribed to accident, but the kind of accident was either not stated at all, or insufficiently for classification. In 11 cases the verdict was "suicide," and in 5 cases murder or manslaughter, without any statement of the method employed. It is unnecessary to go any further with this analysis of verdicts. The examples given sufficiently show that in a large proportion of cases the cause of death is inadequately stated, and that the public is consequently deprived of a considerable part of the advantages which it is entitled to expect in return for its expenditure upon inquests.

The assigned causes of death were distributed in the several classes as follows:—

TABLE K .- MORTALITY FROM THE VARIOUS CLASSES OF DISEASES.

	Total Deaths in 1881.	Rate per Million living.		Decrease or
Causes of Death.		1881.	Mean annual, 1871-80.	Increase per cent. of Rate in 1881.
Zymotic diseases	69,313	2660.2	3727.0	-28.0
Parasitic diseases	1,019	39.1	57.1	-31.5
Dietic diseases	1,704	65.4	63.0	+4.0.
Constitutional diseases	86,709	3327 · 8	3596.8	-7.0
Developmental diseases -	41,244	1582.9	1675.8	-5.0
Local diseases	243,561	9347.8	9928.8	-5:5
Violence	18,160	697.0	737.0	: -4.9
Ill-defined and not specified causes -	30,225	1160.0	1610.8	-21.2
All causes	491,935	18880-2	21396.3	-11.8

Due correction has been made in this table for the changes introduced into the classification, so that the mortality under each class of causes in 1881 is strictly comparable with the mortality assigned to the corresponding class for 1871-80; and it will be noted that, with the unimportant exception of dietic diseases, there was a decline of mortality in each class in 1881, as compared with the mean of the preceding decade.

Zymotic or Specific Febrile Diseases.\*—The deaths ascribed to this class of causes were 69,313, being in the proportion of 2660 to a million persons living, a rate no less than 28 per cent. below the average rate of the preceding decade. The reduction was shared (see Tables 31, 32) by nearly every disease included in the class. Thus the death-rate from enteric fever fell from a mean of 326 per million to 212, to which number however 6 more must be added, making 218, in order to compensate for the fact that deaths under five years of age ascribed to remittent fever were formerly

<sup>\*</sup> Tables (35, 36), which will be found convenient for reference, have been added to this year's report, giving the total number of deaths, and the rate per 1000 living, from each of the principal zymotic diseases for each year since civil registration began. One table deals with all England and Wales, the other with London separately.

Deaths. xxiii

placed to enteric fever, but go now to the heading "remittent fever." The rate from typhus also fell from 58 to 21, and that from other or ill-defined forms of continued fever from 105 to 44. Measles, scarlet fever, and whooping-cough, also showed great diminution and, though the mortality from small-pox, owing to the outbreak in London, was greater than it had been for some years, it was nevertheless below the decennial mean. There was also a great falling off in the mortality from diarrhea, dysentery, and simple cholera. The absence of any long continuance of hot weather in the summer of 1881 reduced the deaths from these bowel disorders to 570 per million persons living, whereas the mean annual rate during the preceding decade had been 943.

There were, however, some exceptions to this nearly universal decrease of mortality. One such exception was presented by diphtheria, the deaths from which disease were 121 per million persons living, which had also been the mean rate in the preceding decade. In these annual reports those deaths only are tabulated as due to diphtheria, in which the cause of death is distinctly designated on the certificate as diphtheria or cynanche maligna or malignant sore-throat. As this rule has been observed throughout the whole series, we may safely use the figures in successive reports for comparative purposes. There can, however, be no doubt that a large proportion of the deaths which were in reality due to diphtheria are returned under other titles, such as ulcerated throat, quinsy, laryngitis, and especially as croup. On this account in previous reports croup and quinsy were placed among the zymotic diseases and next to diphtheria. have been now removed from that position in deference to the classification of the College of Physicians and placed elsewhere; but, be the true nature of these ailments and their correct nosological position what it may, in any attempted estimate of the actual amount of mortality from diphtheria, the indisputable fact of its being very often returned as croup, or as quinsy, or the like, must be borne in mind.

Another heading under which there was no reduction of mortality, and even an increase above the average, was puerperal fever. Some part of this increase may have been real, but in part the rise was only apparent, being due to the system introduced this year, and already mentioned, of sending out letters of inquiry in regard to deaths ascribed to peritonitis and the like, by which 269 additional deaths, which in former years would

have gone elsewhere, were added to puerperal fever.

Parasitic diseases.—The mortality in this small class fell from a mean rate of 57 to one of 39 per million. This decline was due to a great diminution in the deaths ascribed to the somewhat vaguely used term "thrush," the falling off under this heading probably betokening more careful diagnosis and certification of causes.

Dietic diseases.—In this small class there was exceptionally a slight increase of mortality; and it will be seen in Tables 31 and 32, that the increase was under the heading "intemperance." For notwithstanding the diminished consumption of alcoholic drinks, to which returns printed in the Statistical Abstract bear witness, the deaths ascribed to "chronic alcoholism" or to "delirium tremens" were more numerous in proportion to the population than in any of the 24 previous years, with three exceptions. Not impossibly this apparent increase of mortality may, like the diminution under the heading "thrush," be simply due to somewhat more careful certification of causes.

Constitutional diseases.—The death-rate from this class of diseases fell 7 per cent. from the previous decennial average; the chief decline being under the headings "phthisis" and "other tubercular diseases," from which the mortality was at the minimum point as yet reached. On the other

xxiv Deaths.

hand the death-rates from cancer and also from diabetes were at their maxima, doubtless owing to increased accuracy of diagnosis, by which the deaths ascribed to definite causes are always increasing at the expense of the indefinite class.

Developmental diseases.—This class, as now constituted, comprises affections that are confined to the two extreme poles of life, to the earliest infancy or even intra-uterine existence at one end, and to old age at the The deaths ascribed to senility were far below the decennial mean, partly because old age shared with other periods of life in the general reduction of mortality, and still more because for some years there has been an increasing habit of stating the actual disease to which old persons have succumbed, instead of ascribing such deaths simply to old age. this respect doubtless there is still much room for improvement, seeing that even in 1881 there were 25 deaths ascribed simply to old age, though the deceased had not yet passed the 55th year of life, and 729 more of persons who were not over 65. The deaths ascribed to premature birth and to congenital malformations, when measured by their proportion to a million persons living, agreed very closely in number with the decennial mean; but, when measured by the more satisfactory method of the proportion borne by them to births, were in excess. For in the preceding decade there had been 15,128 such deaths to a million births, whereas in 1881 the proportion rose to 16,120.

Local diseases.—In this great class of diseases, which comprises all those which are localised in special organs or systems of organs, and to which nearly half the entire number of deaths is ascribed, there was a diminution of 5.6 per cent. in the death-rate in 1881 as compared with the preceding decade. The main decline was in the sub-group "Diseases of the Respiratory Organs," where the recorded deaths were in the ratio of 3565 per million persons living, against a mean annual rate of 3913 for the preceding decade, in only one of which ten years, viz., 1872, was the rate as low as in 1881. This decline was the more noticeable, inasmuch as the year 1881 was remarkable for the frequent snow-storms that occurred in its first and last quarters, and was more than usually cold, the temperature in the first quarter having been 3.1° F. below the mean of the ten preceding first quarters. On the other hand the year 1872, in which alone the mortality from this sub-group of diseases was lower than

in 1881, was unusually warm.

The only other headings:

The only other headings in this class which call for any notice are "convulsions" and "childbirth." The deaths ascribed simply to convulsions, without any further statement as to the cause to which this symptom was due, had been diminishing year by year, and it is satisfactory to note that in 1881 the deaths, thus inadequately described, were fewer than on any previous occasion. The deaths from childbirth, irrespectively of puerperal fever, bore a much smaller proportion to the total population than had been the case in the previous decade, the rate having fallen from a mean of 04 to one of 74 per million persons living. But this method of comparison, though applicable to most diseases, is clearly unsuited for this special cause of death. The deaths from childbirth must be put into comparison with the number of deliveries, or, what comes practically to the same thing, with the number of births, or rather in this country, where the still-born are not registered, with the number of children born alive. Even, however, when measured in this way the deaths from childbirth in 1881 were below the decennial average, though they were very slightly more numerous than in any one of the three immediately preceding years. (Table 44.) But even this slight apparent increase disappears, when we take into account the addition made to the deaths under this heading by the letters of inquiry, previously mentioned; for, when this correction is made, it will be

found that the deaths ascribed to childbirth remained in 1881 at the same point as they had been for the three immediately preceding years, namely, 2°1 deaths of mothers to 1000 children born alive. When the deaths from puerperal fever are also taken into account, the result is very different; the rate from the two was 4°8 deaths of mothers to 1000 live-born infants, a rate which, had no letters of inquiry been sent out, would have been only 4°4, but which, even when this reduction has been made, was higher than had been the case in any one of the four preceding years.

It need hardly be pointed out that statistics of childbirth mortality such as these, based as they are on such imperfect data, must be used with extreme caution even for the purpose of comparing one year with another, and must be entirely rejected as furnishing any sure basis for estimating the actual mortality due to childbirth in any one year.

Violence.—The deaths from violence were 5'4 per cent. below the decennial mean. The gain was under the heading "accident and negligence," the deaths from suicide being in excess, as had been the case also for several previous years. (See Annual Report 1880.)

Ill-defined and not specified causes.—One death out of every 16 fell into this class. This was, however, a considerable improvement upon the previous decade. As, moreover, the improvement in the statement of causes had been progressive for many years, it is to be hoped that this unsatisfactory class may be eventually reduced to very narrow limits.

Certification of the Causes of Death.—During the year 1881 the causes of 444,483 or 90°4 per cent. of the 491,935 deaths were certified by registered medical practitioners; while the causes of 27,258 or 5°5 per cent. were certified by coroners. The causes of the remaining 20,194, or 4°1 per cent. of the total deaths were not certified. The proportion of uncertified deaths varied very considerably in different parts of England and Wales. In the Metropolis the proportion did not exceed 1°3 per cent. Excluding the metropolitan counties of Middlesex and Surrey, the per-centage did not exceed 0°8 in Wiltshire and 1°7 in Hampshire, while it ranged upwards to 6°7 in Huntingdonshire, 7°0 in Cornwall, 7°2 in Durham, and 7°5 in Herefordshire. In Wales the proportion was 11°0 per cent.

It is satisfactory to note a further slight decline in the proportion of uncertified deaths in 1881, compared with those in 1879 and 1880, which were 4.7 and 4.3 per cent. respectively.

#### PROGRESS OF REGISTRATION.

During the year 1881 the number of names added to the printed alphabetical indexes of births, deaths, and marriages recorded in the national register of England and Wales was 1,770,157. At the close of the year the aggregate number of names in these indexes, which at the close of 1881 embraced a period of  $44\frac{1}{2}$  years, was 64,804,797. The total number of searches in 1881 (including those in non-parochial and other records) was 31,600, showing an increase of 1059 or 3.5 per cent. upon the number in the previous year; the number of certificates issued was 26,572, or 1691 more than in 1880. The amount received as fees for searches and certificates in the year 1881, and paid into Her Majesty's Exchequer, was 4,9761. 128. 6d.

For a list of the various public registers and records lodged in the General Register Office, Somerset House, see the Registrar-General's 34th Annual Report, pp. xxi-xxii and xxv-xxvi.

#### MORTALITY OF THE ARMY.

From returns with which I have been favoured by His Royal Highness the Field Marshal Commanding-in-Chief, it appears that the average strength of the Army at home and abroad was 188,798, and that the number of deaths was 2650; so that the rate of mortality was 14.0 per 1000, against 17.6 in 1880, 22.2 in 1879, and 11.2 in 1878.

The average strength of the Army at home was 91,946, and the deaths

The average strength of the Army at home was 91,946, and the deaths were 844; while the average strength of the Army abroad was 96,852, and the deaths were 1806. The death-rate at home was, therefore, 9 2 per

1000, and the death-rate abroad 18.6. (See Tables 55-60.)

#### MORTALITY OF THE NAVY.\*

The total force in the service afloat, corrected for time, in 1881 was 44,400. The deaths were 486, and, of these, 234 were due to disease and 252 to violence, including one due to poison. The death-rate from disease was 5.27 per 1000, and from violence 5.67 per 1000, against 4.62 and 7.95 respectively in the immediately preceding year. The excessively high death-rate from violence in 1880 was due to the loss of the "Atalanta;" the corresponding rate in 1881, though much lower than this, was still abnormally high as compared with the average, owing to the large loss of life in the explosion of the "Doterel."

The assigned causes of the 234 deaths from disease were as follow:—

Eruptive fevers	5	Diseases of—
Continued fevers	20	Circulatory system - 24
Paroxysmal fevers	10	Respiratory system - 54
0.1 0.1 17 11	_G1	Digestive system - 31

## BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—In accordance with the Births and Deaths Registration Act of 1874, commanding officers of British ships not in Her Majesty's Service, and of foreign vessels trading to or from any port in the United Kingdom, are required, under a penalty, to transmit returns of all births and deaths occurring on board to the Registrar-General of Shipping and Seamen, who furnishes certified copies of such returns to the Registrars-General of England, Scotland, or Ireland. Returns of a similar character are also received from the commanding officers of Her Majesty's ships. The certified copies of births and deaths thus received by me constitute the "Marine Register Book." During the year 1881 the entries recorded in this Register were 350 births and 5220 deaths. Of these 5220 deaths, 2098 were returned as of English origin, and 341 were simply described as of "British" origin.

<sup>\*</sup> The facts in this paragraph are derived from Dr. Lloyd's Report to the Director General of the Medical Department of the Navy.

Among passengers on board merchant vessels at sea (see Table 63), 169 births and 612 deaths were reported during 1881; the deaths showed a marked increase upon the number returned in the preceding year.

Mercantile Marine.—The Registrar-General of Shipping and Seamen reports (see Table 64), that the number of merchant seamen at sea in registered vessels during 1881 was 192,903, showing a further slight decline from the steadily decreasing numbers in the seven preceding years; in 1874 the number of merchant seamen was reported to be 203,606. The deaths from all causes among these merchant seamen during 1881 were 4464, equal to a rate of 23°1 per 1000 of the strength, which exceeded by 1°7 the average annual rate (21°4) during the 30 years 1852–81.

#### EUROPEAN STATES.

In Tables 74-88 will be found international vital statistics relating to thirteen of the principal European States, published in accordance with a resolution of the Statistical Congress, held at St. Petersburg in 1872. Table 74 affords the means for comparing the marriage, birth, and death rates in each State in a series of years, with the mean rate in each series. The following tables contain detailed returns for each State.

The marriage-rate in 1881 showed generally a recovery from the depressed rates in recent years; this recovery was most marked in Austria and Hungary, and in Italy. The rates in those States furnishing returns ranged from 12.4 in Sweden to 19.8 in Hungary.

The birth-rate in the various States varied still more widely, ranging from 29°1 and 29°8 in Sweden and Switzerland, to 38°0 in Italy, 38°7 in Austria, and 43°7 in Hungary. No return has been received from France for 1881, but judging by the returns in previous years the birth-rate was lower than in any other European State. In Italy the birth-rate, as well as the marriage-rate, showed a marked increase in 1881 upon the rates recorded in recent years.

The death-rates in 1881 in those European States furnishing returns were, without a single exception, below the respective average rates in preceding years, and in most cases they were below the rates prevailing in 1880. The lowest rates were 17.7 in Sweden and 18.3 in Denmark, whereas the rates ranged upwards in the other States to 27.2 in Italy, 30.6 in Austria, and 35.6 in Hungary.

I have the honour to be,

Sir.

Your faithful servant,

BRYDGES P. HENNIKER,

Registrar-General.

### APPENDIX TO REPORT.

Alphabetical List of Diseases affected by the Changes of Classification adopted in the present Report.

nce er.	Name of Disease.	Heading to which referr	Heading to which

### REMARKS ON THE METEOROLOGY OF THE YEAR 1881.

#### By James Glaisher, Esq., F.R.S., &c.

The most remarkable occurrences during the year were the frequent falls of snow during the first three months of the year, particularly the unusual fall on January 18th, and in December; the low readings of the thermometer in January, being at or below zero at several stations and the high readings of the thermometer in July being above 90° at many places.

The following remarks with regard to excess or deficiency of atmospheric pressure, temperature, and rain-fall are primarily derived from observations made about London, but they may be taken as applying

generally.

Atmospheric pressure.—The readings of the barometer in the first 10 days of the year were above their average values; the mean daily excess was 0.40 in.; from January 11th to April 6th they were mostly below their average; within this period there were 24 days on which the average was reached, or exceeded, and 61 days on which it was not reached; the average deficiency of mean daily pressure for the 85 days ending April 6th was 0.17 in.; from April 7th to June 22nd the pressure was alternately above and below for a few days together, usually 4 or 5, those above being more numerous; the mean daily excess of pressure for the 77 days ending June 22nd was 0.06 in.; from June 23rd to July 18th, with the exception of 3 days, the readings were above their average, the mean daily excess being 0.12 in.; from July 19th to August 7th the readings were alternately above and below; from August 8th to September 12th the average daily deficiency was o'19 in.; from September 13th to 16th the pressure was in excess and then in defect till September 22nd; from September 23rd to October 8th the average daily excess was 0.32 in.; from October 9th to November 4th the pressure was for 5 or 6 days together, a little above, and then for 5 or 6 days a little below, the average; for the 20 days ending November 24th, the pressure was in excess to the average of 0.16 daily; this was followed by 4 days of low readings, the average deficiency being 0.49 in.; then by 8 days of excess, when the average was 0°22 in.; from December 7th to 15th, the readings were alternately above and below their averages; the readings in the week ending December 22nd were all low, the average deficiency being 0.46 daily, and in the week following they were all high, the average excess being o 41 in. and the readings on December 30th and December 31st, were below their averages.

The highest reading in the year at the height of 150 feet was 30.486 inches on May 10th, and the lowest 28.710 inches on January 20th;

thus giving a range of 1.776 inches.

Temperature.—Till the 6th day of January the weather was mild; on the 8th a very cold period set in and continued to the 27th, the average daily deficiency of mean temperature for these 20 days was 9°·7; on several days the deficiency exceeded 14° and 15°, and on two days, the 20th and 21st, it was more then 16½°; the minimum temperatures at several stations are shown in the following Table:

TABLE showing the MINIMUM TEMPERATURE of the AIR at the several Stations on January 12th to January 28th.

From this table we see that the lowest temperature on the 12th was 12°·5 at Carlisle and Stockton; on the 13th, 11°·5 at Marlborough; on the 14th, 4°·0 at Carlisle; on the 15th, 0°·5 at Carlisle; on the 16th, -5°·5 at Carlisle; on the 17th, -2°·0 at Carlisle; on the 18th, 5°·6 at Carlisle; on the 19th, 13°·3 at Stonyhurst; on the 20th, 3° at Stockton; on the 21st, -2° at Cambridge; on the 22nd, 1°·0 at Cardington; on the 23rd, 8°·8 at Totues; on the 24th, 4°·2 at Carlisle; on the 25th, 7°·3 at Wrottesley; on the 26th, 2°·2 at Carlisle; on the 27th, 7°·2 at Carlisle; and on the 28th, 25° at Bywell, 29°·1 at Bradford, but on this day the reading was above 30° at every other station. An examination of the table line by line shows the lowest temperature at each station; at Guernsey the lowest was 24°·5 on the 16th; at Truro it was 12° on the 15th, and there were several readings below 20°; the lowest at Eastbourne was 12°·8, at Plymouth 17°, at Totnes 8°·8, at Torquay 15°·3, at Ventnor 14°·6, at Osborne 12°, at Bournemouth 12°·1, at Brighton 11°·4, at Salisbury 2°·5, at Barnstaple 8°, at Bath 8°·8, at Ramsgate 15°, at Strathfield Turgiss 3°·9, at Marlborough 6°·9, at Bristol 9°, at Whitchurch 5°·3. All these stations are south of London, and the low temperatures recorded at them are therefore remarkable.

This very cold period was followed by a fortnight of moderately warm weather, whose average daily excess was 3°·4; this was succeeded by a cold period of 21 days duration, the average daily deficiency being 3°·6; then a warm period of 17 days, during which the excess of daily tem-

perature was sometimes as much as 9°, 10°, or 11°, and the average excess was 6°; from March 21st to April 9th was cold, the average daily deficiency being 3°.8; from April 10th to 18th it was warm, the average daily excess being 4°·7; from April 19th to May 22nd, with the exception of a few days, was cold, the average daily deficiency of these 34 days was 1°.6; a fortnight of warm weather followed extending to June 4th whose average daily excess was 5° 3; this was followed by 10 days whose average daily deficiency of temperature was of the same amount, viz., 5°3; 4 days of moderately warm weather followed, and this was succeeded by 12 days of rather cold weather; from July 1st to 5th the weather was warm, the mean daily excess of temperature was 8°.8. The 5th of July was a hot day, a thunderstorm occurred, and on July 6th at many stations the maxima shade temperatures were 20°, 30°, and 35° lower than those of the preceding day, and from the 6th to the 9th the weather was cold; then for II days the weather was hot; on the 15th the excess of mean temperature was 12° 7, and, on this day, temperatures exceeding 90° were recorded at many stations; the average daily excess of mean temperature of these 11 days was 6° 6.

The following Table shows the maximum temperatures at the several stations, during the periods of high temperature in July.

TABLE showing the MAXIMUM TEMPERATURES at the several Stations on July 1st to 5th, and from July 11th to 19th.

On looking over this table it will be seen how very great the difference of maximum daily temperatures has been at the different places; on the 1st the temperature exceeded 80° at several stations between Blackheath and Norwich, the highest being 87° 6 at Cardington; whilst at Liverpool the temperature only reached 62°.7, and at Llandudno 63°.7: on the 2nd the extremes were at Eastbourne and Salisbury 80° and 80° 5 respectively, whilst at Bradford and Llandudno 60° and 60°.7 were the highest respectively; on the 3rd there were many places between Salisbury and Leeds, with readings of 80° or more, the highest was 84° 7 at Greenwich; whilst at Lancaster the highest reading was 63°, and at Bristol 66° 3; on the 4th there were several stations between Truro and Leeds with readings exceeding 80°; the highest was 90° 3 at Nottingham, whilst at Lancaster the highest reading was 62°, and at Carlisle 66°.3. On the 5th, temperatures exceeding 90° took place at many stations between Salisbury and Nottingham, the highest being 93° 5 at Salisbury; on this day the maximum temperature at Bermerside was 61°, at Truro 64°, and at Torquay 68° 6. On the 11th the extremes were 86° at Sunderland, and 56° at Liverpool; on the 12th, temperatures exceeding 80° were recorded at several stations between Osborne and Nottingham, the highest was 86° 2 at Greenwich; whilst at Liverpool the highest was 50°, and at Lancaster 66°. On the 13th the extremes were 83° 9 at Whitchurch, and 60° at Bermerside; on the 14th the temperature exceeded 80° at many places, and was 91°·3 at Whitchurch, and 91° at Sunderland, whilst at Lancaster it was 63°, and at Torquay 67°.7. The most remarkable day was the 15th, when the highest temperature was 97° 1 at Greenwich; the next in order 95° 6 at Osborne; 94° 6 at Camden Square, and 94° at Blackheath; at several other stations above 90°, and at many between 80° and 90°. On this day at Bermerside the highest temperature was 64°, and at Liverpool and Lancaster 66°. These high temperatures are in great contrast to the minimum temperatures in January. This warm period was followed by a cold one extending from July 21st to September 16th, with the exception of the few days between August 4th and 8th, the average daily deficiency of mean temperature for these 58 days was 3°·2; from September 17th to September 26th, was moderately warm, this was succeeded by 38 days extending to November 3rd of cold weather, the average daily deficiency was 4°6; from November 4th to December 7th, was warm, the mean daily excess being as large as 5°.4; the weather was cold between December 8th and 22nd, the average daily deficiency being 2°.6, and from December 26th to the end of the year the weather was warm.

Rainfall.—The fall of rain about London in January was 1°16 in., being 0°75 in. below its average; in February it was 2°43 ins., being 0°87 in. higher than its average; in March was 1°84 in., being 0°29 in. higher than its average. The fall in April was 0°62 in., in May was 1°62 in., in June was 1°86 in., being respectively 1°14 in., 0°46 in., and 0°14 in. below their averages. In July the fall of rain was 2°13 ins., being 0°44 in. below its average; in August was 3°88 ins., being 1°45 in. above its average. The fall in September was 2°18 ins., in October was 2°70 ins., and in November 2°27 ins., being 0°24 in., 0°11 in. and 0°07 in. below their averages respectively, and in December was 2°55 ins., being 0°56 in. above its average. The total fall during the year was 25°12 ins. The total falls of rain ranged from 58°32 ins. at Bolton, 49°87 ins. at Stonyhurst, 49°66 ins. at Totnes, to 23°09 ins. at Gloucester, 23°98 ins. at Oxford, and 24°02 ins. at Royston. The greatest number of rainy days in the year were 223 at Bolton, 222 at Bradford, and 215 at Nottingham; and the least were 120 at Gloucester, 134 at Osborne, and 149 at Strathfield Turgiss.

Thunderstorms occurred on 48 days during the year, of these 9 were in June, 8 in August, 7 in both May and July, 4 both in September and

November, 3 in April, 3 in December, 2 in February, one in January, and there were none in either March or October. The storms of May, July, August, September, and November were general over the country, those in February, April, and December were mostly in the Midland and Southern counties. The storm in January at North Shields was very severe.

Thunder was heard but lightning was not seen on 57 days during the year, 40 days being in the months of May, June, July, and August. The greatest number of days in one month was 12 in June, and the least was one in March. Thunder was not heard at any place in January, October, or December.

Lightning was seen but thunder was not heard on 35 days during the year, none of which were in either January, February, March, or April; the greatest number of days in one month was 9, in July.

Solar halos were seen on 46 days during the year. On 8 in both September and November, 6 in August, 5 in both July and October, 4 in February and March and December, and 2 in January, and none in April, May, or June, and when seen at one place were generally seen at all parts of the country.

Lunar halos were seen on 47 nights in the year. On 8 in November, 7 in March, 6 in April, 5 in both February and December, 4 in January, 3 in July, September, and October, 2 in May, one in August, and none in June, and were generally visible over the country at the same time.

Auroræ boreales were seen on 8 days during the year, on the 31st all over the country in January; on the 19th and 20th of March at Carlisle; on the 20th of April at Cambridge, Bermerside, and Stonyhurst; on the 21st and 22nd of October at Carlisle; on the 23rd of November at Cardington; and on the 15th of December at Blackheath.

Snow fell on 79 days during the year, 19 in March, 18 in January, 16 in February, 13 in December, 5 in October, 4 in both April and November. The falls in January, February, March, April, November, and December were general all over the country, those in October were mostly confined to the Midland and Northern districts. The day in spring on which the last snow fell was April 21st, and the first day it fell in the following autumn was October 15th at Wolverhampton. The snowstorm of the 18th day of January was very remarkable; this day was bitterly cold and there was a gale from the east, with driving snow that penetrated everywhere. snow began to fall about 9.0 a.m. and at midnight, at Blackheath, in places free from drift, it was 15 inches in depth; nearly all the lines of railway out of London were blocked, and some of them early in the afternoon; trains were embedded in the snow all night and during the next day. This snowstorm extended southward to Jersey and Guernsey, where the depth was from 12 ins. to 14 ins., with drifts up to four and five feet. In the Isle of Wight the depth was about 15 ins., and Mr. Mann says the island was white with snow from the 17th to the 29th; a second heavy fall of 18 ins. having taken place on the 20th; the total depth of snow which fell on these two days was therefore 33 ins. On the 18th day the depth of snow at Brighton was 18 ins,; in Cornwall and Devonshire it was from 12 to 14 ins., with drifts of from 10 to 12 feet; the amounts were less proceeding northwards, at Cambridge the depth was 8 ins., and at Leeds and Bradford, the fall was very small. The loss of life in England due to the snow was great, and small birds died in great numbers, their food being covered by the snow. Dr. Compton, of South Bourne, says, "Rooks were " seen to kill and eat sparrows, and blackbirds to each eat other on my " lawn, where a great congregation of birds were collected."

Hail fell on 84 days during the year; on 13 in October, 12 in both February and in March, 10 in April, 8 in December, 7 in January, 6 in May and October, 5 in June, 2 in August and September, and one in July.

Fog prevailed on 171 different days during the year (exceeding the number recorded in 1875 by 21 days), and they were distributed as follows; January 28, February 22, March 16, April 8, May 13, June 11, July 6, August 6, September 14, October 13, November 16, and December 18.

Throughout the year fog was frequent over the country in May, June, and July; it was mostly prevalent in the southern counties.

Note.—The Births and Deaths Registration Act of 1874, which rendered the registration of births compulsory, came into operation on 1st January 1875.

\* These estimates are calculated upon the numbers enumerated at the Censuses taken in 1841-51-61-71-81. For the estimated numbers of the males and females in each year, and population estimates for years prior to 1838, see Table 73.

											V	

NOTE.—In some cases of marriages between Protestants and Roman Catholics the couples are married twice, and are counted twice in the Registers; such cases are, however, so few, that this source of error may be practically disregarded. Marriages of divorced men and women are classified in this Table as marriages of hachelors and spinsters.

Table 7.—Marriages in England, and Annual Rate of Persons Married per 1000 living, in each Quarter of the Forty-four Years 1838-81.

<sup>\*</sup> The population used in these calculations is deduced from the ascertained rates of increase observed in the 41 years 1841-81 (see Table 73), distributed in the several groups of ages according to the proportions found to prevail at the Censuses in 1841, 1851, 1861, and 1871.

<sup>\*</sup> The mean annual prices of coal are derived from a Parliamentary Return (225 of 1881) furnished by the Registrar of the London Coal Market, by order of the House of Commons. The mean quarterly prices were supplied from time to time to the Registrar-General by Mr. Richard Meade, of the Mining Record Office.

Note.—The number of Deaths in the cols. 3 to 6 are estimated on the assumption that the soldiers abroad belonged to the different parts of the British Empire in the proportions indicated in Table 61; previously to 1861 the proportions used are those existing in 1851, the proportions which prevailed in 1860 being used for the 10 years 1861-70, the proportions at the Census in 1871 for the 10 years 1871-80, and those prevailing at the Census in 1881 for that year.

Table 63.—Births and Deaths among Passengers, British Subjects, on board Merchant Vessels at Sea, including Soldiers, Marines, and invalided Seamen from the Royal Navy, in the Twenty-six Years 1856-1881, reported by the Captains or Commanding Officers of Vessels to the Registrar General of Shipping and Seamen at the Termination of their respective Voyages in Ports of the United Kingdom.

(Furnished to the Registrar General by the Registrar General of Shipping and Seamen.)

<sup>\*</sup> Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Shipping and Seamen, Since 1867 the return includes seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls, or officers of the hospitals, on their discharge from their ships.

If a seaman die on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel be not to return direct to the United Kingdom. But if a passenger die on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given; in the accompanying tables the births and deaths are classed according to the years in which they were reported. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occur in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew and the names of the passengers, when known, to the Registrar General of Shipping and Seamen.

Table 65.—Return of the Ages and Causes of Death of 4,464 Seamen reported to the Board of Trade in 1881 as having died in the British Merchant Service. (Parliamentary Return, Session of 1882.)

# Table 67.—Changes in the Constitution of the Registration Districts and Sub-districts during the Year 1881.

[N.B.-(1.) The Name of the District is in SMALL CAPITALS, that of the Sub-district in Italics.

(9.)	The Populations	quoted are the N	imbers enumerate	d at the Cer	asus of 1881.

No. of District.	Name of District,	Date of Change.	Nature of Change.
28	LEWISHAM	10 June -	The sub-district of Lewisham Village was re-named Lewisham.
32	GUILDFORD	1 July -	The parish of Merrow (population 595) was transferred from the sub-district of <i>Albury</i> to that of <i>Gutlaford</i> .
110	ANDOVER	1 January -	The sub-district of $Ludgershall$ was re-named $Amport$ .
209	HARTISMERE	1 October -	The sub-district of Eye was abolished. The parishes of Braiseworth, Eye, Occold, Redlingfield, Stoke Ash, and Thorndon All Saints (aggregate population 4113), were added to Mendlesham sub-district, and the remainder, consisting of the parishes of Brome, Oakley, Stuston, Thornham Magna, Thornham Parva, Thrandestone and Yaxley (aggregate population 1799) to Botesdale sub-district.
237	King's Lynn	1 February	The sub-districts of King's Lynn North and King's Lynn Middle were united under the name of King's Lynn North sub-district (population 11,629).
"	,, • •	1 October -	The sub-districts of King's Lynn South and King's Lynn North were united under the name of King's Lynn sub-district (population 19,206).
449	NANTWICH	14 July -	The sub-district of Wybunbury was re-named Crewe.
454	TOXTETH PARK	1 January -	For the constitution of this new Superintendent Registrar's District, see WEST DERBY (455).
455	WEST DERBY	,, •	The sub-district of Toxteth Park (population 117,028) was separated from West Derby and created a Superintendent Registrar's District named Tox- TETH PARK (454).
466	MANCHESTER	1 December	The sub-districts of Deansgate and Market Street were united under the name of Central sub-district (population 41,683).
565	BERWICK	1 November	The sub-districts of Norhamshire and Islandshire were united under the name of Norhamshire and Islandshire sub-district (population 6449).

Under the provisions of "The Divided Parishes and Poor Law Amendment Act, 1876," small changes have been made in the constitution of the following Districts:—MIDHURST (85), HOWDEN (518), KENDAL (579), GOWER (598); and interchanges between the following pairs of Districts:—GUILDFORD (32) and FARNHAM (33), GUILDFORD (32) and HAMBLEDON (34), PETWORTH (80) and MIDHURST (85), MARKET DRAYTON (356) and NEWPORT (358), BURTON-ON-TRENT (867) and ASHBY-DE-LA-ZOUCH (406), MERIDEN (388) and ATHERSTONE (389), ATHERSTONE (389) and MARKET BOSWORTH (407), BOSTON (417) and HORNCASTLE (421), BOSTON (417) and SPILSBY (422), and HORNCASTLE (421) and SPILSBY (422).

Note.—The population in the four years 1802-65 and in the years 1807-69 was estimated by means of the average annual rate of increase observed between the two enumerations of 1801 and 1806. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which they were last domiciled.

\*\*Census years.\*\*

| Cholera prevailed in 1805.05 and we record to record the commune of the commune in which they were last domiciled. † Cholera prevailed in 1865-66, and war raged in 1870 and 1871.

<sup>†</sup> Cholera prevailed in 1866, and small-pox in 1871.

<sup>#</sup> Estimated to middle of year.

TABLE 87.—SPAIN. Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Years 1861 to 1870.

.1869	16,883,986	~ 137,120	274,240	602,287	550,660	16.2	85.7	-32-6		
1870	16,935,613	105,543	211,086	<b>599,</b> 786	509,669	, 12-5	35.4	30.1		

Note.—The Population enumerated at the Census of 1860 was 15,673,536. The estimated Population for the Years subsequent to 1861 has been deduced from the Excess of Births over Deaths in each Year. The decline of registered marriages in 1870 is believed to be due to the introduction of civil registration, which coursed during that year.

\*\*Census year.

Table 88.—ITALY. Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Years 1864 to 1881.

(Furnished by Professor L. Bodio, Director of General Italian Statistics.)

<sup>\*</sup> Census years. The population figures given for census years show the numbers enumerated on 31st December in each of those years; whereas for each of the other years the population is estimated to the middle of the year. The population in inter-census years are somewhat over-estimated through account having been taken of emigration.

Note,—The facts for Rome were first included with those for the Kingdom of Italy in 1872.

The Registration or Union Counties consist of groups of Superintendent Registrars' Districts which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal from the District, or the greater part of the population, is located. The boundaries of Registration Counties therefore differ more or less from the boundaries of Counties (proper).

These areas were furnished to the Registrar General by the Ordanace Survey Department for the purposes of the Census of 1871. They do not include space occupied by foreshore or tidal water of rivers and creeks.

the Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1881.

‡ W	here th	e parti	es to a	marria	ge are	e of diff	ferent 1	eligion	s persu	asions	it som	etimes	happen	s that	the cer	emony is performed according

The parties to a marriage are of different religious persuasions it sometimes happens that the eremony is performed according to the rites of both persuasions; in these cases the two ceremonies are entered as two marriages. Divorced men and women who marry are classified in these Abstracts as bachelors and spinsters. For particulars of marriages of persons stated to have been previously divorced, see Table G., page Xiii.

ABSTRACT OF MARRIAGES.—Marriages registered in England, pursuant to the

<sup>•</sup> The 620 Districts, which are arranged according to their local position, are collections of contiguous Parishes or Places, nearly always identical with the Poor Law Unions of the same names. They were re-numbered on the 1st January 1881.

† 1.—The District of Kensington comprises the two Poor Law Unions of Paddington and Kensington.

Note.-For area and population of the Registration Divisions and Counties, see pages 2 and 4.

<sup>\*</sup> The Registration Counties consist of groups of Superintendent Registrars' Districts, which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal town of the District, or the greater part of the oppulation, is located. The boundaries of the Registration Counties therefore differ more or less from the boundaries of the Counties (proper).

<sup>\*</sup> The Superintendent Registrars' Districts (630 in number) are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are nearly always identical with the Poor Law Unions of the same names; they are arranged, according to the local position, under the Registration Counties. The Sub-districts (2171 in number at the end of the year 1881) are sub-divisions of Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter W denotes that the Sub-district contains within its limits a Workhouse Establishment belonging to the District or Union; windicates that a Workhouse Establishment receiving inmates from other Districts than the one in which it stands is included; H indicates a Hospital or Infirmary; L a Lunatic Asylum; and repetitions of any of these letters show the number of such Institutions in each Registration Sub-district.

<sup>†</sup> Wherever the minus sign (-) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated. The Excess of Deaths over Births is often attributable to the mortality in Institutions. The Deaths in the principal Institutions of England in 1881 are given on pages 93-114.

<sup>‡ 1.</sup> The Registration District of Kensington comprises the two Poor Law Unions of Paddington (St. Mary Paddington and St. John Paddington Sub-districts) and Kensington (Kensington Town and Brompton Sub-districts).

<sup>\* 449: 1.—</sup>On the 14th July the name of this Sub-district was changed from Wybunbury to Crewe.
† 450.—The District of Chester comprises the three Poor Law Unions of Tarvin (Tattenhall Sub-district), Chester (Castle and Chester Cathedral Sub-district), and Hawarden (Hawarden Sub-district).
† 454 and 455.—On the 1st January 1881, Toxteth Park, formerly a Sub-district in the District of West Derby, was constituted a Superintendent Registrar's District.

		1.								

<sup>\* 630.—</sup>The District of Anglescy comprises the two Poor Law Unions of Anglescy (Llangefni, Llandyfrydog, and Amlwch Sub-districts) and Holyhead (Bryngwran, Llanddausaint, and Holyhead Sub-districts).

The parishes of Bodewryd and Rhosbeiro, however, situated in Llanddausaint Sub-district belong to the Union of Anglescy, and not to the Union of Holyhead.

# DEATHS IN PUBLIC INSTITUTIONS,

1881.

The following pages contain the numbers of deaths registered during 1881 in most of the Public Institutions of England. These figures afford the means of correcting the mortality of districts and sub-districts in which Public Institutions are situated. The list includes Workhouses, Hospitals, Infirmaries, and Public Lunatic Asylums, while Prisons, Almshouses, Schools, Private Lunatic Asylums and Benevolent Asylums, are excluded. The list, as settled, includes 1499 Institutions; of which 722 are Workhouses, Workhouse Infirmaries, or Workhouse Schools; 691 Hospitals or Infirmaries; and 86 Lunatic Asylums. The Lunatic Asylums are mostly County Asylums, but a few private Asylums which receive pauper patients are also included. In these 1499 Institutions 53,187 deaths were registered during the year, or 10·8 per cent. of the total deaths in England and Wales, against 10·1 and 9·4 per cent. in the two preceding years; 34,502 occurred in Workhouses, 13,822 in Hospitals, and 4,863 in Lunatic Asylums. The proportion to total deaths was 7·0 per cent. in Workhouses, 2·8 in Hospitals, and 1·0 in Lunatic Asylums.

Information relating to the deaths recorded in many Private Lunatic Asylums, and Charitable Institutions, will be found in the notes to the following pages.

Deaths registered in the Public Institutions of England in the Year 1881.

	Accident (not otherwise described)  Injury or Fracture (how caused or of what kind not stated)	164		11							11		7 25		27			10	

<sup>\*</sup> When a person dies from an operation, which was performed on account of any disease or injury the nature of which is stated in the certificate, the death is classed under that disease or injury. The same is done with deaths attributed to Traumatic Tetanus. The figure above refer, therefore, only to those deaths from operation and those deaths from Traumatic Tetanus concerning which no further information was obtained.

Of the above 11,539 Accidents, 88 are stated to have occurred to Persons in a state of Intoxicati and 16 to Persons suffering from Delirium Tremens. And in 288 other cases Death was accerated by the supervention of Erysipelas, Mortification, Pyæmia, or Tetanus. Here follow details:—

### INDEX OF DISTRICTS.

The following Index furnishes a reference to the Number of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report. The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and not under A.

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted in the Abstracts for the year 1847, the districts were re-numbered consecutively from 1 to 630 in the

Abstracts for the year 1881.\*

For names of Towns, such as Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 228) and "Index of certain Towns" (page 238).

Aberayron, 604. Abergavenny, 582. Aberystwith, 605. Abingdon, 115. Alcester, 397. Alderbury (Salisbury), 254. Alnwick, 563. Alresford, 105. Alston, 568. Alton, 106. Altrincham, 445. Alverstoke, 89. Amersham, 140. Amesbury, 253. Ampthill, 173. Andover, 110. Anglesey, 630. Ashborne, 438. Ashby-de-la-Zouch, 406. Ashton-under-Lyne, 468. Aston, 387. Atcham (Shrewsbury) 351. Atherstone, 389. Auckland, 545. Axbridge, 315. Axminster, 269. Aylesbury, 143. Aylsham, 223. Aysgarth, 539.

### $\mathbf{B}$

Bakewell, 440. Bala, 623. Banbury, 155. Bangor, 628. Barnet, 128. Barnsley, 506. Barnstaple, 285. Barrow-in-Furness, 482. Barrow-upon-Soar, 408. Barton Regis, 321. Barton-upon-Irwell, 463. Basford, 430. Basingstoke, 108. Bath, 317. Battle, 69. Beaminster, 267. Bedale, 537.

Bedford, 171. Bedminster, 319. Bedwelty, 583. Belford, 564. Bellingham, 561. Belper, 437. Berkhampstead, 139. Berwick, 565. Bethnal Green, 16. Beverley, 519. Bicester, 151. Bideford, 287. Biggleswade, 172. Billericay, 191. Billesdon, 402. Bingham, 434. Birkenhead, 452. Birmingham, 386. Bishop Stortford, 131. Blaby, 403. Blackburn, 474. Blandford, 260. Blean, 58. Blofield, 228. Blything, 216. Bodmin, 294. Bolton, 461. Bootle, 576. Bosmere, 211. Boston, 417. Bourn, 414. Brackley, 156. Bradfield, 118. Bradford-on-Avon, 249. Bradford (Yorkshire), 497. Braintree, 199. Bramley, 500. Brampton, 570. Brecknock, 608. Brentford, 126. Bridge, 56. Bridgend, 589. Bridgnorth, 348. Bridgwater, 307. Bridlington, 525. Bridport, 268. Brighton, 77. Bristol, 320. Brixworth, 162. Bromley, 41.

Bromsgrove, 384. Bromyard, 341. Buckingham, 146. Builth, 607. Burnley, 472. Burton-upon-Trent, 367. Bury, 462. Bury St. Edmunds, 206.

C Caistor, 424. Calne, 245. Camberwell, 26. Cambridge, 179. Camelford, 290. Cannock, 370. Canterbury, 57. Cardiff, 586. Cardigan, 601. Carlisle, 572. Carmarthen, 597. Carnarvon, 627. Castle Ward, 558. Catherington, 103. Caxton, 177. Chapel-en-le-Frith, 441. Chard, 309. Cheadle, 365. Chelmsford, 192. Chelsea, 3. Cheltenham, 335. Chepstow, 580. Chertsey, 31. Chester, 450. Chesterfield, 439. Chester-le-Street, 552. Chesterton, 178. Chichester, 84. Chippenham, 244. Chipping Norton, 154. Chipping Sodbury, 322. Chorley, 475. Chorlton, 464. Christchurch, 93. Church Stretton, 346. Cirencester, 331. Cleobury Mortimer, 347. Clitheroe, 473.

<sup>\*</sup> Thus, the number of Marriages in the Aberayron District may at once be ascertained by referring to the "Abstract of Marriages," District number 604 (see page 24); and the numbers of Births and Deaths, of Deaths at different Ages, &c. will be found by referring to the same district number in the respective Tables.

Clun, 345. Clutton, 316. Cockermouth, 574. Colchester, 196. Congleton, 448. Conway, 629. Cookham, 121. Corwen, 622. Cosford, 204. Coventry, 392. Cranbrook, 52. Crediton, 282. Crickhade, 242. Cricklade, 242. Croydon, 38. Cuckfield, 75.

### D

Darlington, 542. Dartford, 42. Daventry, 161. Depwade, 230. Derby, 436. Devizes, 247. Dewsbury, 502. Docking, 235. Dolgelly, 624. Doncaster, 511. Dorchester, 265. Dorking, 35. Dover, 64. Downham, 238. Driffield, 524. Droitwich, 383. Droxford, 102. Dudley, 374. Dulverton, 304. Dunmow, 200. Durham, 549. Dursley, 324.

### E

Easington, 550. Easingwold, 528. East Ashford, 55. Eastbourne, 70. East Grinstead, 74. Easthampstead, 122 East Preston (Worthing), 82. East Retford, 427. Eastry, 63. East Stonehouse, 278. East Ward, 577. Ecclesall Bierlow, 508. Edmonton, 129. Elham, 65. Ellesmere, 353. Ely, 182 Epping, 187. Epsom, 30. Erpingham, 222 Eton, 141. Evesham, 381. Exeter, 272.

### INDEX OF SUB-DISTRICTS.

[This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having compound names in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus, Abbey Holme (573; 2) is the 2d Sub-District of the Wigton District, No. 573.]
